1.-2. (Cancelled)

1

AMENDMENTS TO THE CLAIMS

This listing of claims will replace all prior versions, and listings, of claims in the application:

(Currently Amended) The method of claim 2, A method of communications 1 3. 2 between first and second wireless networks, comprising: receiving data containing a private network address of a first node in the first 3 4 wireless network; 5 translating the private network address to a public network address; and sending data containing the public network address translated from the private 6 7 network address to a second node in the second wireless network, wherein the received data comprises a data packet, and wherein translating the 8 9 private network address comprises translating the private network address in a header of the data 10 packet, wherein translating the private network address further comprises translating the 11 12 private network address in a payload portion of the data packet. 4. (Currently Amended) The method of claim 1 A method of communications 1 between first and second wireless networks, comprising: 2 receiving data containing a private network address of a first node in the first 3 4 wireless network; translating the private network address to a public network address; and 5 sending data containing the public network address translated from the private 6 network address to a second node in the second wireless network, 7 wherein receiving data comprises receiving data containing a General Packet 8 9 Radio Service Tunneling Protocol data unit.

1	5. (Currently Amended) The method of claim 1 A method of communications
2	between first and second wireless networks, comprising:
3	receiving data containing a private network address of a first node in the first
4	wireless network;
5	translating the private network address to a public network address; and
6	sending data containing the public network address translated from the private
7	network address to a second node in the second wireless network,
8	wherein receiving data comprises receiving data from a Serving General packet
9	radio service Support Node in the first wireless network, the first node comprising the Serving
10	General packet radio service Support Node.
1	6. (Original) The method of claim 5, wherein sending data comprises sending data
2	to a Gateway General packet radio service Support Node, the second node comprising the
3	Gateway General packet radio service Support Node.
1	7. (Currently Amended) The method of claim 1, further comprising A method of
2	communications between first and second wireless networks, comprising:
3	receiving data containing a private network address of a first node in the first
4	wireless network;
5	translating the private network address to a public network address;
6	sending data containing the public network address translated from the private
7	network address to a second node in the second wireless network; and
8	determining whether to establish a data session on a packet data network on
9	behalf of a roaming mobile station through the first wireless network or the second wireless
10	network.
1	8. (Original) The method of claim 7, wherein the receiving, translating, and sending
2	acts are performed by a network element between the first and second wireless networks.

9. (Currently Amended) The method of claim [[1]] 3, wherein the translating is 1 2 performed by a network address translator. An article comprising at least one storage medium containing 10. 1 (Original) 2 instructions that when executed cause a system to: receive a packet having a header portion and a payload portion from a first node 3 in a first wireless network, the payload portion containing a private network address of the first 4 5 node; translate the private network address in the header portion and in the payload 6 7 portion to a public network address; and send the packet containing the public network address to a second node in a 8 second wireless network. 9 (Original) The article of claim 10, wherein the instructions when executed cause 1 11. the system to send the packet containing the public network address in the header portion of the 2 3 packet and the payload portion of the packet. 12. (Original) The article of claim 10, wherein the instructions when executed cause 1 the system to translate the private network address in the payload portion by identifying a string 2 3 in the payload portion containing the private network address. (Original) The article of claim 10, wherein the instructions when executed cause 1 13. the system to receive the packet containing General Packet Radio Service Tunneling Protocol 2 3 data. (Original) The article of claim 10, wherein the instructions when executed cause 14. 1 2 the system to receive the packet from a Serving General packet radio service Support Node in the first wireless network, the first node comprising the General Packet Radio Service support node. 3

- 1 15. (Original) The article of claim 14, wherein the instructions when executed cause 2 the system to send the packet to a Gateway General packet radio service Support Node in a 3 second wireless network.
 - 16. (Original) The article of claim 15, wherein the instructions when executed cause the system to receive the packet from the Serving General packet radio service Support Node associated with a first public land mobile network and to send the packet to the Gateway General packet radio service Support Node associated with a second public land mobile network.
 - 17. (Original) The article of claim 10, wherein the instructions when executed cause the system to receive the packet from the first wireless network associated with a first network operator and to send the packet to a node in a second wireless network associated with a second network operator.
 - 18. (Original) A system comprising:
 - an interface to a first wireless network, the interface adapted to receive a data packet containing a header portion and a payload portion, the payload portion containing a first network address of a node in the first wireless network; and
 - a network address translator module adapted to translate the first network address to a second, different network address associated with the node.
 - 19. (Original) The system of claim 18, further comprising a controller adapted to send the data packet containing the second network address to a second wireless network.
 - 20. (Original) The system of claim 19, wherein the first wireless network is associated with a first network operator and the second wireless network is associated with a second network operator.
- 1 21. (Original) The system of claim 18, wherein the interface is adapted to receive the data packet comprising an Internet Protocol packet.

of the packet to the public network address.

3

22. (Original) The system of claim 21, further comprising a controller adapted to 1 2 send the data packet containing the second network address to a second wireless network, the 3 data packet comprising an Internet Protocol packet. (Original) The system of claim 18, wherein the interface is adapted to receive the 23. 1 2 data packet having a General Packet Radio Service Tunneling Protocol data unit in the payload 3 portion of the data packet. (Original) The system of claim 18, wherein the first network address comprises a 24. 1 private network address of the node, and wherein the second network address comprises a public 2 3 network address of the node. (Currently Amended) A data signal embodied in a carrier wave and comprising 1 25. instructions that when executed cause a system to: 2 3 perform one-to-one translation of a private network address and a public network address in a packet received from a first wireless network, the private and public network 4 5 addresses associated with a Serving General packet radio service Support node in the first 6 wireless network; and send the packet with a translated network address to a second wireless network. 7 (New) The data signal of claim 25, wherein performing the one-to-one translation 1 26. comprises performing a translation of the private network address contained in a payload section 2
